Good luck!

Problem 1. (8 points) A tank holds 10gal of brine containing 40lb of salt. It is filled with brine (containing 5lb/gal salt) at a rate of 3gal/min. At the same time, well-mixed solution flows out at a rate of 2gal/min. How much salt is in the tank after t minutes?

Armin Straub

Problem 2. (3 points) In the differential equation $(x+2y)\dfrac{\mathrm{d}y}{\mathrm{d}x} = \tan\Big(-\dfrac{y}{x^2}\Big)$ substitute $u = \dfrac{y}{x^2}$.
What is the resulting differential equation for u? No need to simplify! Do not attempt to solve!

Problem 3. (3 points) Find the general solution to the differential equation $y'' + y' = 2y$.

Problem 4. (3 points) Consider the initial value problem $(y^2-1)y' + \sin(x) = x^2$, $y(a) = b$. For which values of a and b can we guarantee existence and uniqueness of a (local) solution?

Problem 5. (3 points) A rising population is modeled by the equation $\frac{\mathrm{d}P}{\mathrm{d}t} = 300P - 3P^2$. Answer the following questions without solving the differential equation.

(a) When the population size stabilizes in the long term, how big will the population be?

(b) What is the population size when it is growing the fastest?

Armin Straub

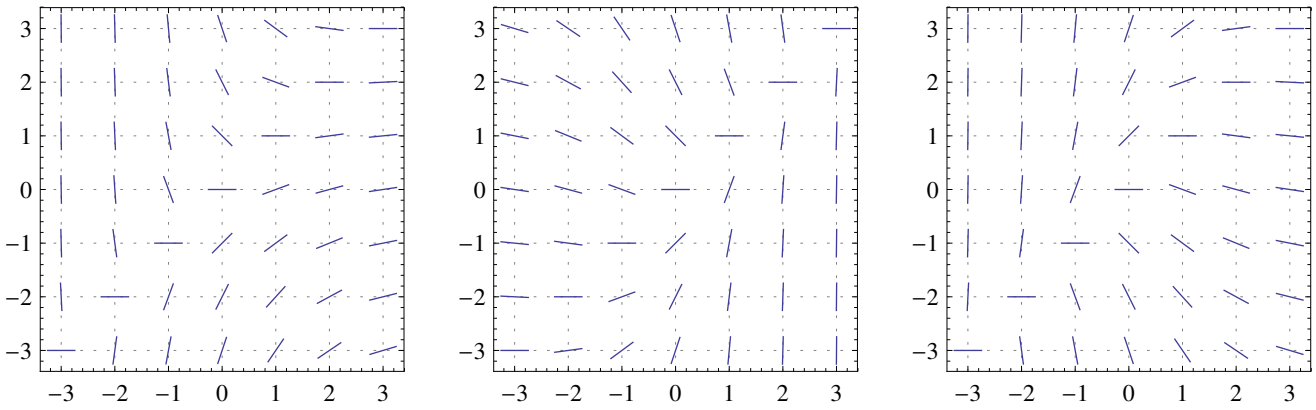
Problem 6. (2 points) Circle the slope field below which belongs to the differential equation $e^x y' = y - x$.



Problem 7. (4 points) Solve the initial value problem $\frac{\mathrm{d}y}{\mathrm{d}x} + y^2 \sin(x) = 0$ with $y(0) = 3$.

Problem 8. (4 points) Consider the IVP $\frac{\mathrm{d}y}{\mathrm{d}x} - y^2 = x$ with $y(1) = -1$. Approximate the solution $y(x)$ for $x \in [1, 2]$ using Euler's method with 2 steps. In particular, what is the approximation of $y(2)$?
